Basic Information

Safety Notes

Install and operate Regal Rexnord products in conformance with applicable local and national safety codes and per Regal Rexnord installation manuals which are available upon request. Suitable guards for rotating members may be purchased from Regal Rexnord as optional accessories. Refer to your local Regal Rexnord district office for complete details.

WARNING: *Lock out power source and remove all external loads from gear drive system and from backstop before servicing drive or accessories. Locking out the power source and removing the load will reduce the possibility of an unexpected motion or reaction in the system.*

People Conveying Equipment — Selection of Regal Rexnord products for applications whose primary purpose is the transportation of people is not approved. This includes such applications as freight or passenger elevators, escalators, man lifts, work lift platforms, ski tows, and ski lifts.

If the primary purpose of the application is material conveyance and occasionally people are transported, the Regal Rexnord warranty may remain in effect provided the design load conditions are not exceeded and certification to the appropriate safety codes and load conditions has been obtained by the system designer or end user from the appropriate enforcement authorities.

Lubricants — Refer to Manuals 568-101, 568-102, 568-104, and 568-110 for a listing of transmission fluids, oils, and greases that meet Regal Rexnord specifications.

Stored or Inactive Backstops — Backstops, sizes 1075-1185NRT are shipped without lubricant, with one ounce of Motorstor[Ⓢ] vapor phase rust inhibitor in the backstop that protects the internal parts against rust for a period of six months.

If the backstop (sizes 1075-1185) is to be stored or inactive for more than six months, add lubricant and Motorstor as recommended in the service manual for every additional six-month period. Indoor storage or a suitable covering is recommended.

Backstop, size 1045NRTH, Style B, is shipped with grease. If stored, rotate inner hub every two months to lubricate rotating elements.

Backstops, sizes 1055NRTH, 1065NRTH, and 1085NRTH, Style B, are shipped from the factory filled to the proper level with oil. If stored, rotate inner hub every two months to lubricate rotating elements.

Backstops, sizes 1055 and 1065NRTH, Style C, are prelubricated and require no further maintenance of the working mechanism.

If an installed backstop is to remain inoperative for an extended period of time, remove the load before shutting down the equipment. Refer to service manual for complete instructions.

Ⓢ Product of the Daubert Chemical Company, Chicago, IL.

How to Select Falk™ True Hold™ NRT & NRTH Backstops — Imperial

(Refer to page 22 for explanation of terms and page 19 for how to order)

- Determine Drive Arrangements from page 6
- Determine System Torque
 - Fig. 1 — Single motor, single backstop arrangements.
 - Fig. 2 — Tandem motor, single backstop arrangements.
 - Fig. 3 — Tandem motor, tandem backstop arrangements.
 - Figs. 4 and 5 — Refer these arrangements to the factory for selection.

Combine the horsepower from both motors for Fig. 2 and Fig. 3.

$$\text{System Torque} = \frac{5250 (\text{MHP or BHP or LHP})}{\text{rpm (rev/min)}}$$

MHP — Motor Nameplate HP

BHP — Brake HP (calculated load). Use only if more than 75% of motor rating.

LHP ① — Lift HP (calculated power to lift the load vertically. Use only if more than 75% of motor rating.)

① LHP can be calculated as follows:

$$\frac{\text{Short Tons Per Hour (TPH)} \times \text{Lift in Feet}}{990}$$

- Determine Required Backstop Torque

② Required Backstop Torque =

$$\frac{\text{System Torque (MHP, BHP, LHP)} \times \text{Motor Maximum Torque (Stall or Breakdown Torque\% ③)}}{150\%}$$

② For Figure 3 — Tandem motor, tandem backstop arrangements, select each backstop to hold 60% of the total required backstop torque.

③ Use whichever is greater.

- From pages 7 thru 9, select backstop with a torque rating equal to or greater than the required torque rating determined above.
- Check the maximum bore, pages 7 thru 9. If a larger bore is required, select the next larger size or reduce shaft diameter.
- Check the maximum overrunning speed from pages 7 thru 9. Refer to the factory for higher speeds.
- Check backstop reaction force at torque arm stirrup, Table 4, page 17.
- Backstop and torque arm dimensions are listed on pages 7 thru 9; allow space for installation.
- Only use keys furnished by the factory.

If the backstop is mounted on the double-ended extension of the drive shaft, check shaft stresses and use dual path (safety lock) couplings or a minimum 2.0 service factor on the combined horsepower for the coupling on the NRT side.

Indexing requirements must be referred to the factory for selection.

- NRTH Style B and NRTH Style C backstops are rated for more than 1,000,000 cycles of backstopping.
- NRT Backstops are rated for 100,000 backstopping cycles.
If your application needs more than 100,000 load cycles, refer application to the factory for selection.

Engineered Selection Method for Inclined Conveyors — It is possible to fine tune the selection and possibly consider the selection of a smaller size backstop, if detailed loading and conveyor profile information is furnished.

The following data is necessary:

- Power to lift the load (vertical)
- Power to move empty belt (friction)
- Power to move loaded belt horizontally (friction)

We can calculate these values if the following data is provided:

- Conveyor length (L) — feet
- Belt speed — fpm
- Short tons per hour — tph
- Total lift (H) — feet
- Belt width — inches
- Material weight — lb/ft³ (cubic ft)
- Pulley rpm (rev/min) or diameter — feet

Selection Example

The selection examples below show the benefits gained from obtaining the required information to select by brake or lift torque vs. motor torque.

Steep Slope Conveyor	
200 Motor HP	
180 Brake HP	
150 Lift HP	
200% Stall	
68 rpm (rev/min)	
4.9375 Dia	
Motor HP and Stall % Known	
$\frac{200 \text{ MPH} \times 5250}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
20,588 lb-ft Motor Torque	
Size 1095 NRT	
Brake HP Known	
$\frac{180 \text{ MPH} \times 5250}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
18,529 lb-ft Brake Torque	
Size 1095 NRT	
Lift HP Known	
$\frac{150 \text{ MPH} \times 5250}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
15,441 lb-ft Lift Torque	
Size 1085 NRT	

How to Select Falk™ True Hold™ NRT & NRTH Backstops — Metric

(Refer to page 22 for explanation of terms and page 19 for how to order)

- Determine Drive Arrangements from page 6
- Determine System Torque
 - Fig. 1 — Single motor, single backstop arrangements.
 - Fig. 2 — Tandem motor, single backstop arrangements.
 - Fig. 3 — Tandem motor, tandem backstop arrangements.
 - Figs. 4 and 5 — Refer these arrangements to the factory for selection.

Combine the kilowatts from both motors for Fig. 2 and Fig. 3.

$$\text{System Torque} = \frac{9550 (\text{MkW or BkW or LkW})}{\text{rpm (rev/min)}}$$

MkW — Motor(s) Nameplate kW

BkW — Brake kW (calculated load). Use only if more than 75% of motor rating.

LkW ① — Lift kW (calculated power to lift the load vertically. Use only if more than 75% of motor rating.)

① LkW can be calculated as follows:

$$\frac{\text{Metric Tons Per Hour (TPH)} \times \text{Lift in Meter}}{367}$$

- Determine Required Backstop Torque

② Required Backstop Torque =

$$\frac{\text{System Torque} \times \text{Motor Maximum Torque (Stall or Breakdown Torque\% ③)}}{150\%}$$

② For Figure 3 — Tandem motor, tandem backstop arrangements, select each backstop to hold 60% of the total required backstop torque.

③ Use whichever is greater.

- From pages 7, 8, or 10 select backstop with a torque rating equal to or greater than the required torque rating determined above.
- Check the maximum bore, pages 7, 8, or 10. If a larger bore is required, select the next larger size or reduce shaft diameter.
- Check the maximum overrunning speed from pages 7, 8, or 10. Refer to the factory for higher speeds.
- Check backstop reaction force at torque arm stirrup, Table 4, page 17.
- Backstop and torque arm dimensions are listed on pages 7, 8, or 10; allow space for installation.
- Only use keys furnished by the factory.

If the backstop is mounted on the double-ended extension of the drive shaft, check shaft stresses and use dual path (safety lock) couplings or a minimum 2.0 service factor on the combined horsepower for the coupling on the NRT side.

Indexing requirements must be referred to the factory for selection.

- NRTH Style B and NRTH Style C backstops are rated for more than 1,000,000 cycles of backstopping.
- NRT Backstops are rated for 100,000 backstopping cycles.
If your application needs more than 100,000 load cycles, refer application to the factory for selection.

Engineered Selection Method for Inclined Conveyors — It is possible to fine tune the selection and possibly consider the selection of a smaller size backstop, if detailed loading and conveyor profile information is furnished.

The following data is necessary:

- Power to lift the load (vertical)
- Power to move empty belt (friction)
- Power to move loaded belt horizontally (friction)

We can calculate these values if the following data is provided:

- Conveyor length (L) — meters
- Belt speed — (mpm)
- Metric tons per hour — tph
- Total lift (H) — meters
- Belt width — millimeters
- Material weight — Kg/M³ (cubic meter)
- Pulley rpm (rev/min) or diameter — meters

Selection Example

The selection examples below show the benefits gained from obtaining the required information to select by brake or lift torque vs. motor torque.

Steep Slope Conveyor	
150 Motor kW	
135 Brake kW	
115 Lift kW	
200% Stall	
68 rpm (rev/min)	
125 mm Dia	
Motor kW and Stall % Known	
$\frac{150 \text{ MkW} \times 9550}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
20,588 Nm Motor Torque	
Size 1095 NRT	
Brake kW Known	
$\frac{135 \text{ BkW} \times 9550}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
25,279 Nm Brake Torque	
Size 1095 NRT	
Lift kW Known	
$\frac{115 \text{ LkW} \times 9550}{68 \text{ RPM}} \times \frac{200\%}{150} =$	
21,534 Nm Lift Torque	
Size 1085 NRT	

Common Drive Arrangements

Figure 1 — Single motor, single backstop arrangements

Figure 2 — Tandem motor, single backstop arrangements –
Select backstop to hold the **entire** system torque.

Figure 3 — Tandem motor, tandem backstop, single pulley arrangements –
Select each backstop to hold at least 60% of total system backstop torque.

For drive arrangements shown in Figures 4 & 5, engineered selections, indexing applications, vertical applications or for drive arrangements not shown, refer to the factory for selection.

We will select a backstop for you if you furnish the following information:

- Drive arrangement
- Motor nameplate power
- Motor maximum torque as % of nameplate
- Headshaft rpm (rev/min), diameter, diameter tolerance, length, and key dimensions
- Duty cycle

If available, the following information when furnished may make it possible to select a smaller size backstop:

- Brake power
- Lift hp power

Figure 4 — Tandem motor, tandem backstop, dual pulley arrangement –
Refer to the factory for selection.

Figure 5 — Dual motor, dual backstop, dual pulley arrangement –
Refer to the factory for selection.

- ① Key is furnished by the factory.
- ② Length through hub.
- ③ 1085NRTH – Hole for lifting purposes only.
- ④ Minimum shaft engagement for backstop support.
- ⑤ Fasteners are Hex Socket Head Cap Screws, Grade 8.
- ⑥ Weight shown is for backstop with minimum bore.
- ⑦ 1045NRTH backstops are shipped with Lubriplate AERO NLGI #1/Grease Lubricant. 1045NRTH backstops require a keeper plate or retaining collars for axial retention.
- ⑧ 1055, 1065, and 1085NRTH backstops are shipped with lubricant (DEXRON). 1055, 1065, and 1085NRTH backstops are furnished with four radial holes and setscrews in the inner cam for axial retention on the shaft.

Mounting Positions — The backstop rotational axis must be horizontal within 5°. The backstop and torque arm may be mounted at any desired angle. Horizontal or near horizontal mounting of the torque arm provides maximum bearing life.

Purchaser — The purchaser is responsible for assembling the backstop, air vent, and torque arm. A 125 micro-inch (3.2 micro-meters), or finer, shaft finish is recommended.

① Key is furnished by the factory.

② Length through hub.

③ Minimum shaft engagement for backstop support.

④ Fasteners are Hex Socket Head Cap Screws, Grade 8.

⑤ Weight shown is for backstop with minimum bore.

⑥ Style C, size 1055 and 1065NRTH backstops are shipped permanently lubricated, no additional lubrication or re-lubrication is required. Grease fittings for optional purging of seals are provided.

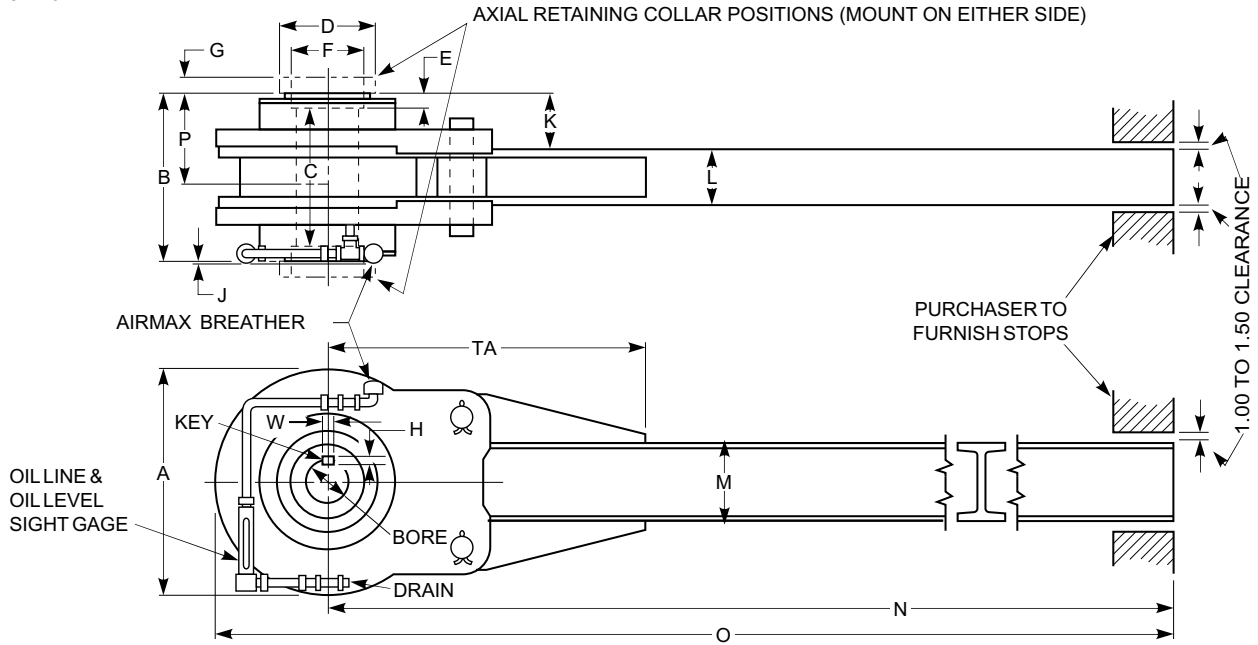

Mounting Positions — The backstop rotational axis must be horizontal within 5°.

The backstop and torque arm may be mounted at any desired angle. Horizontal or near horizontal mounting of the torque arm provides maximum bearing life.

Purchaser — The purchaser is responsible for assembling the backstop, air vent, and torque arm. A 125 micro-inch (3.2 micro-meters), or finer, shaft finish is recommended.

- ① Dimensions are for reference only and are subject to change without notice unless certified.
- ② Refer to the factory for higher maximum overrunning speeds.
- ③ Key is furnished by the factory.
- ④ Counterbore is for manufacturing.
- ⑤ Dimension G is the retaining collar thickness for one collar. Size 1075 bores 3.50" and over, Size 1085 bores 4.75" and over, Size 1105 bores 7.00" and over, and Size 1115 bores over 8.00" require two collars (one on each side) or one collar with a step in the shaft. Check usable shaft length if two (2) collars are used.

- ⑥ Weight shown is for backstop with minimum bore and without oil.
- ⑦ Size 1075 with bores over 3.4375", D = 6.50".
- ⑧ Size 1085 with bores over 4.75", D = 7.20", G = .80".
- ⑨ Size 1105 with bores over 6.9375", D = 10.50", G = 1.24".
- ⑩ Size 1115 with bores over 8.00", D = 12.12"

Purchaser — The purchaser is responsible for assembling the backstop retaining collar (when furnished), oil line, oil level sight gauge, air vent, and for furnishing the oil and the torque arm stirrup per the Regal Rexnord service manual. A 125 micro-inch, or finer, shaft finish is recommended.

Mounting Positions — The backstop rotational axis must be horizontal within 5°.

The backstop and torque arm may be mounted at any desired angle, but the position must be specified to permit furnishing of oil lines to suit the mounting. Horizontal or near horizontal mounting of the torque arm provides maximum bearing life.

NOTE: Electronic drawings are available from the Rexnord website: www.rexnord.com

- ① Dimensions are for reference only and are subject to change without notice unless certified.
- ② Refer to the factory for higher maximum overrunning speeds.
- ③ Backstops are provided with standard metric keys and keyways per ISO 773 and DIN 6885-1 Standard D10 clearance fit.
- ④ Counterbore is for manufacturing.
- ⑤ Dimension G is the retaining collar thickness for one collar. Size 1075 bores over 90mm, Size 1085 bores over 121 mm, Size 1095 over 140mm, Size 1105 bores 180mm and over, Size 1115 bores over 200mm, and Size 1125 bores over 230mm require two collars(one on each side) or one collar with a step in the shaft. Check useable shaft length if two (2) collars are used.

- ⑥ Weight shown is for backstop with minimum bore and without oil.
- ⑦ Size 1075 with bores over 90 mm, D = 165 mm.
- ⑧ Size 1085 with bores over 120 mm, D = 183 mm, G = 20 mm.
- ⑨ Size 1095 with bores over 135 mm, D = 234 mm, G = 25 mm.
- ⑩ Size 1105 with bores over 175 mm, D = 267 mm, G = 32 mm.
- ⑪ Size 1115 with bores over 200 mm D = 308 mm.
- ⑫ Size 1125 with bores over 230 mm, D = 345 mm.

Mounting Positions — The backstop rotational axis must be horizontal within 5°. The backstop and torque arm may be mounted at any desired angle, but the position must be specified to permit furnishing of oil lines to suit the mounting. Horizontal or near horizontal mounting of the torque arm provides maximum bearing life.

Purchaser — The purchaser is responsible for assembling the backstop retaining collar (when furnished), oil line, oil level sight gauge, air vent, and for furnishing the oil and the torque arm stirrup per the Regal Rexnord service manual. A 3.2 micro-meter, or finer, shaft finish is recommended.

NOTE: Electronic drawings are available from the Rexnord website: www.rexnord.com

Backstop Operation — NRT

Overrunning

Figure 6 — For most of its operating life, a backstop is in the overrunning mode of operation.

The rollers, roller cage, and stop lugs rotate with the inner cam as a unit since they are connected by the energizing springs.

The outer race does not rotate since it is bolted to the end covers, which are held by the backstop torque arm.

Figure 7 — While overrunning, the rollers roll on the outer race and slide on the inner cam ramps. Friction and centrifugal force tend to lift the rollers off the cam, minimizing contact and wear.

Figure 6

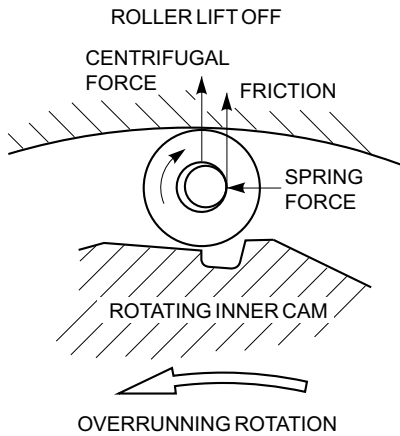

Figure 7

The energizing springs stretch during overrunning to provide tension to the roller cage assembly (Figure 6). This tension keeps the rollers ready for instantaneous backstopping engagement and minimizes the relative rotation of the roller cage to the inner cam.

The stop lugs axially position the roller cage assembly on the inner cam. They also prevent the roller cage from rotating too far, which would cause the rollers to strike the upright side of the adjacent ramp. Maximum relative rotation of the roller cage assembly and inner cam during overrunning is between .040" (1.02 mm) and .100" (2.54 mm), depending on size, as limited by the stop lugs.

Backstopping

Figure 8 — As the rotating shaft stops and attempts to reverse, the inner cam is instantly stopped by the wedging action of the rollers in the annular openings between the cam ramps and outer race.

From the outer race, the backstopping torque is carried through the end covers to the torque arm and the adjoining superstructure.

Figure 9 — All rollers are engaged simultaneously since they are positioned by the spring-loaded roller cage.

Load division between the rollers is assured by machining accuracy of the inner cam ramps, rollers, roller cage, and outer race.

Figure 8

Figure 9

As additional backstopping torque is applied to the inner cam, the rollers will tend to move deeper into the wedging position, thereby increasing the resistance to slippage. Relative rotational movement between initial backstopping engagement at no load to backstopping at full catalog rating is approximately 1.5° to 3°.

The torque capacity of the backstop is based on the tangential friction resistance force at the outer race developed by the compressive force between the inner cam ramps, rollers, and outer race.

The maximum torque capacity of the backstop is limited by the Hertzian contact stress at inner cam/roller and roller/outer race contact points, bending strength of torque arm, and hoop stress of outer race.

Backstop Operation — NRTB Styles B and C

The NRTB styles B and C backstops are an addition to the Regal Rexnord line of roller-ramp backstops. These backstops operate on the proven principal of sprag technology, which has been around since the mid 1950s. The sprag technology has advanced over the years with improvements in materials and heat treatment processes.

NRTB Style B

The NRTB Style B backstops are designed for lower operating speed applications. The design features three primary components: a cylindrical inner race, a cylindrical outer race, and a sprag cage consisting of a full complement of individually tensioned sprags.

The proprietary geometry of the sprags allows for the one-way operation of the backstop (see Figure 10). During normal operation of the backstop, the inner race rotates in the free direction while the outer race remains stationary. During an attempted reversal of the backstop, torque is instantly transmitted from the inner race, through the sprags, to the outer race, which is held stationary with a torque arm. The features of the backstops are zero backlash, large bore capacity, large torque capacity and grease purge cavities on sizes 1055, 1065, and 1085.

NOTE: If all the upgraded features of the NRT style backstop are not required, then consider the 1055, 1065, and 1085 NRTB Style B backstops as a less expensive alternative to the NRT backstop design.

Figure 10

(1055, 1065, and 1085 ONLY)

NRTB Style C

The NRTB Style C backstops are offered in sizes 1055 and 1065, and are designed for a higher operating speed than the Style B. The centrifugal lift-off sprag is a feature exclusive to the NRTB Style C design in the NRT family of Regal Rexnord backstops. This feature incorporates a special sprag design with an offset center of gravity. During overrunning, centrifugal force, F_c , causes the individually tensioned sprags to lift off the outer race, thereby allowing the sprags to operate without wear (Figure 11). When the overrunning

speed of the backstop has reduced sufficiently so that the centrifugal force is less than the spring force, the sprags will return to their contact positions and stand ready to transmit torque without backlash (Figure 12). Special features are increased service life, reduced heat generated, high overrunning speeds, and sealed for life design (minimum maintenance).

OVERRUNNING (LIFT OFF)

Figure 12

BACKSTOPPING

Service Parts (Type NRT Backstops)

INTRODUCTION — Give complete data shown on the backstop nameplate and name of parts required. Complete data will assure receipt of the correct parts.

COVER GASKETS — When end covers are removed to replace oil seals, order new cover gaskets to prevent oil leakage.

Type NRT — Backstop Parts

Part Description
Lubrication Assembly ^①
Air Vent Assembly
Oil Level Gauge
Torque Arm
Bearing (each)
Oil Seal (each)
Cover Fasteners (set) ^②
Cover Gasket (each)

① Assembly shown includes sight gauge, air vent, and all piping, tees, and elbows required.

② Cover fastener; two sets are required per backstop.

PART DESCRIPTIONS

1. End Cover	7. Roller Cage End Rings (2)	11. Optional Axial Retaining Collar	13. Roller Cage Fasteners
2. Gasket	8. Inner Cam	12. Stop Lug	14. Rotation Direction Plate
3. Bearing	9. Outer Race		15. End Cover Fasteners
4. Outer Seal	10. Labyrinth Shroud (not available on all sizes)		16. Torque Arm
5. Inner Seal			17. Torque Arm Pin
6. Rollers			

Dismantling, Repair, & Parts Replacement

WARNING: DO NOT attempt to service or remove backstop before removing load.

An important part of the Falk™ NRT backstop manufacturing process is the full load and overrunning testing with specially instrumented equipment. Consequently, return NRT backstops to Regal Rexnord for repair and full load testing.

Except for replacement of oil seals (Service Manual 568-130), NRT backstops should not be dismantled or repaired in the field. If seals are to be replaced, it is important that the cam and roller assemblies not be removed from the outer race. Removal will void applicable warranties.

When writing to Regal Rexnord Service Parts Department concerning required service, state nature of problem and give complete data from backstop nameplate, M.O. number, size, date, etc.

Contact: gear.service.parts@rexnord.com

Engineering Recommendations

Backstop Applications — Falk™ NRT and NRTH backstops are designed to prevent reverse rotation in applications such as inclined conveyors, bucket elevators, fans, rotary pumps, and kilns. If local safety codes permit, the backstop may be used as a backup for a brake on those applications, but NOT in people conveying systems such as elevators, manlifts, ski tows or ski lifts. Also, DO NOT use the backstop as a substitute for a brake.

Indexing — Falk NRT and NRTH backstops can be used for indexing service, provided there is one complete revolution of the backstop between backstopping cycles. Refer application data to the factory for selection.

Safety Standards — The backstop and normal associated equipment (shaft, pulleys, etc.) involve moving parts; therefore, consult local, state, OSHA, and ANSI safety codes for proper guarding of revolving parts and possible pinch points (a pinch point occurs at the contact point between the backstop torque arm and support, and between the torque arm and stirrup).

Operating Temperature — Enclosure of the backstop may cause overheating. Provide adequate ventilation. Backstop operating temperatures, at maximum overrunning speed, may reach 200°F (93°C). Determine the effect of this temperature on the driven equipment and provide cooling if necessary.

If a backstop operates in the sun at ambient temperatures over 100°F (38°C), then special measures should be taken to protect the backstop from solar energy. This protection can consist of a canopy over the backstop or reflective paint on the backstop. If neither is possible, a cooling device such as a fan may be required to prevent the sump temperature from exceeding the allowable maximum of 200°F (93°C).

Keys & Keyways — Keys used with NRT and NRTH backstops are furnished by the factory. Keys are either mild steel, cold drawn 1045 steel or heat treated alloy steel (310-350 HB). Use only those keys provided by the factory (see Table 1).

Do not use sled runner type keyway. It may induce undue forces on backstop.

① Backstop supplied with H7 bore assuming h6 shaft (ANSI tolerance specification). Backstop key and keyway tolerance per FDN 430-152 assuming shaft keyway per ANSI B17.1

② Number 1 keys are cold drawn 1045 steel. Number 2 keys are heat-treated alloy steel (310 - 350 HB). Number 3 keys are mild steel.

③ Keys are furnished by Regal Rexnord to suit shaft and backstop keyways. Keys are either cold drawn 1045 or heat-treated alloy steel (310 - 350 HB). Only use keys furnished by the factory. Shaft keyway depth tolerance of -.000" -.010" is recommended.

Engineering Recommendations

① Backstops supplied with E7 bore and D10 keyway assuming m6 shaft diameter and h9 keyway (ISO tolerance specification).

② Number 1 keys are cold drawn 1045 steel. Number 2 keys are heat-treated alloy steel (310 - 350 HB). Number 3 keys are mild steel.

③ Keys are furnished by Regal Rexnord to suit shaft and backstop keyways. Keys are either cold drawn 1045 or heat-treated alloy steel (310 - 350 HB). Only use keys furnished by the factory. Shaft keyway depth tolerance of -.000 -.025 mm is recommended.

Engineering Recommendations

Table 2 — Backstop-Shaft Fits — Inch

Nominal Diameter (From-Included)	Nominal Shaft Tolerance	Nominal Bore Diameter Tolerance	Base-Shaft Clearance ^①
1.2500 – 1.5000	+0.0000, – .0005	+0.0005, +0.0015	.0005 – .0020
1.5000 – 2.9375	+0.0000, – .0010	+0.0005, +0.0015	.0005 – .0025
3.0000 – 7.9375	+0.0000, – .0010	+0.0010, +0.0025	.0010 – .0035
8.0000 – 11.9375	+0.0000, – .0010	+0.0015, +0.0035	.0015 – .0045
12.0000 – 14.9375	+0.0000, – .0010	+0.0020, +0.0045	.0020 – .0055
15.0000 – 20.0000	+0.0000, – .0020	+0.0020, +0.0045	.0020 – .0065

① 125 micro-inch (or finer) shaft finish and clearance fit specified above are recommended.

Table 3 — Metric Bores for Backstops

Nominal Diameter (Over-To) (mm)	Nominal Shaft Tolerance (mm) ^②	Nominal Bore Tolerance (mm) ^③	Bore-Shaft Clearance Min-Max (mm)
30 – 50 k6	.002 / .018	.025 / .050	.007 – .048
50 – 80 m6	.011 / .030	.060 / .090	.030 – .079
80 – 120 m6	.013 / .035	.072 / .107	.037 – .094
120 – 180 m6	.015 / .040	.085 / .125	.045 – .110
180 – 250 m6	.017 / .046	.100 / .146	.054 – .129
250 – 315 m6	.020 / .052	.110 / .162	.058 – .142
315 – 400 m6	.021 / .057	.125 / .182	.068 – .161
400 – 500 m6	.023 / .063	.135 / .198	.072 – .175

② Shaft diameters from 30 – 50 mm are k6 tolerance and shaft diameters over 50 – 500 mm are m6 tolerance.

③ Bore diameters from 30 – 50 mm are F7 tolerance and bore diameters over 50 mm to 500 mm are E7 tolerance.

A 3.2 micro-meter (or finer) shaft finish is recommended. For shaft tolerances other than those listed in the table, consult Factory for bore tolerance (specify your shaft tolerance).

Table 4 — Backstop Reaction Force at Torque Arm Stirrup (Inch & Metric)

Backstop Size	Catalog Torque Rating		N Torque Arm Length (See drawing on next page.)		.9N +/- .5" (12.7 mm)		Torque Arm Reaction Force ^④

1175NRT	519,000	704,000	120.00	3048	108.00	2745	86,500	384,850
1185NRT	747,000	1,013,000	120.00	3048	108.00	2745	124,500	553,800

④ Reaction force is based on .9N torque arm length and 1.5 catalog rating:

$$\text{Force (lb)} = \frac{1.50 \times \text{Catalog Torque Rating (lb-ft)} \times 12 \text{ (in per ft)}}{.9N \text{ (in)}}$$

$$\text{Force (N)} = \frac{150 \times \text{Catalog Torque Rating} \times 1000 \text{ (mm per m)}}{.9N \text{ (mm)}}$$

For reduced length torque arms, substitute actual N dimension in formula.

Engineering Recommendations

Backstop Mounting Positions — The supporting shaft must be horizontal within 5° for NRTH and NRT backstops. The backstop torque arm assembly may be rotated to any angular position, but the position must be specified by the purchaser to permit Regal Rexnord to furnish oil lines to suit the mounting for Type NRT.

The symmetrical backstop design permits turning the backstop end for end to provide either direction of shaft rotation. The backstop overrunning (or free rotation) direction is indicated by a rotation arrow on each side of the backstop.

For NRT backstops, the purchaser is responsible for mounting the backstop retaining collar, oil line, oil level sight gauge, and air vent, and for furnishing the oil and the torque arm stirrup per the Regal Rexnord service manual.

Torque Arm Stirrups — Locate torque arm stirrup at .9N as illustrated at right. Design the stirrup to withstand the Torque Arm Reaction Force listed in Table 4. If the stirrup must be located closer, design the stirrup to withstand the force developed by the actual torque applied to the backstop. Use the following formula to determine the force.

$$\text{Actual Reaction} = \frac{\text{Drive Pulley Peak Torque}}{\text{Actual Application Dimension } N}$$

The torque arm must be free to move within the stirrup. Provide clearance on three sides as shown at right. DO NOT restrict torque arm movement by welding or securing to any supporting structure.

Locate the torque arm support surface parallel ($\pm 1/2^\circ$) to the axis of the shaft on which the backstop is mounted.

A boot or hood is recommended for all positions of the torque arm to prevent accumulation of material around the torque arm stirrup. This also provides a guard against a possible pinch point. DO NOT restrict movement of the torque arm.

Grease Purged Seals — The option of adding grease is the purchaser's. Adding grease to the outer cavity seal is NOT RECOMMENDED if grease could contaminate the material being processed as in the food and drug industries. The company adds grease between the inner and outer seals for NRT backstops. DO NOT purge this inner cavity in the field.

SIDE VIEW

END VIEW

How to Order

The following information, along with selection information from pages 7 thru 10, is required to order a backstop:

- Type of torque used to select (motor, brake, or lift)
- Torque arm mounting position (see pages 7-10)
- Overrunning rotation
- Number of retaining collars

System Characteristics — Supply any information about the system to which the Falk™ NRT or NRTH backstop is being applied that would affect the selection of the backstop (or holdback); for example, “Are there any torque limiting devices with the motors? Is material feed restricted in any way to prevent overload of the material handling system? Will the system produce overloads that could exceed the motor’s stall torque capacity?”

NRT / NRTH Backstop Order Information Required (or previous Falk M.O. Number)

	Size
	Quantity
	Backstop Rotation (CW or CCW)
	Shaft Diameter and Tolerance (mm or inches)
	Available Shaft Length (mm or inches)
	Kwy ____ x ____ (mm or inches)
	Torque Arm Position in Degrees (See illustrations on pages 7 thru 10)
	If Non-Std Torque Arm, Advise ‘N’ Dim. pages 9 & 10 (inches or mm)
	Power (Indicate kW or Hp, Lift, Demand or Motor)
	RPM of Shaft that Backstop is Mounted Upon
	% Motor Stall Torque or Max. Overload Torque
	% Stall Torque
	Number of Retaining Collars

NOTE: Provide information above, plus a drive layout schematic for multiple pulley applications.

Metric Backstops — supplied with E7 bore and D10 keyway, assuming m6 shaft diameter and h9 keyway (ISO tolerance specification).

Inch Backstops — supplied with H7 bore, assuming h6 shaft (ANSI tolerance specification). Backstop key and keyway tolerance per FDN 430-152, assuming shaft keyway per ANSI B17.1.

Backstop Selection Procedure Definitions

Application Terms

Brake hp (BHP) Brake kW (BkW)	The calculated load required to operate the equipment. For conveyors, brake hp (kW) is based on the horsepower (kilowatts) required to overcome both friction, and the horsepower (kilowatts) required to lift the load vertically.
Drive Pulley	A pulley mounted on the headshaft which supplies power to move conveyor belt.
Lift hp (LHP) Lift kW (LkW)	Horsepower (kilowatts) required to only lift the load vertically.
Motor hp (MHP) Motor kW (MkW)	Motor nameplate rating.
Motor Starting Torque	Torque that the motor is capable of supplying at zero rpm (rev./min.) for approximately 15 seconds in a design B motor or six seconds in a design C motor to start equipment. Also called locked rotor torque.
Motor Stall Torque	Torque required to stop motor rotor from operating and is generally caused by overload conditions.
Motor Breakdown Torque	Maximum torque the motor produces (at about 75% of speed).
Drive Pulley hp (kW)	Horsepower (kilowatts) supplied to drive pulley.
Single Pulley Drive	One drive pulley provides all power to conveyor.
Tandem Motor Drive	Two motors driving one drive pulley drive.
Tandem Pulley Drive	Two pulleys are used to power conveyor, but are driven by one motor through a dual output drive arrangement. This is not commonly used today.
Dual Pulley Drive	Two pulleys are used to power conveyor and each pulley is driven by a separate motor(s).
Headshaft	Shaft at head or high point of conveyor.
Indexing	Continuous cyclic or periodic applications of the backstop as encountered in the conversion of reciprocating or oscillating motion into intermittent linear motion.
Jogging	Stop/start movement with jerking or jolting motion.

Backstop Terms

Backstop Rating	Catalog torque rating.
Backstop Load	Load applied to the backstop.
Backstop Operation	Engagement of backstop rollers and outer race.
Tandem Backstops	Two backstops on the same drive pulley.
Dual Backstops	Two backstops on the same conveyor, but each on separate drive pulley.
